Outline

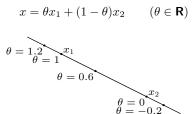

Convex set

Convex functions

Convex problems

Affine set

line through x_1 , x_2 : all points

affine set: contains the line through any two distinct points in the set

example: solution set of linear equations $\{x \mid Ax = b\}$

(conversely, every affine set can be expressed as solution set of system of linear equations)

Convex sets 2–2

Convex set

line segment between x_1 and x_2 : all points

$$x = \theta x_1 + (1 - \theta)x_2$$

with $0 < \theta < 1$

convex set: contains line segment between any two points in the set

$$x_1, x_2 \in C, \quad 0 < \theta < 1 \implies \theta x_1 + (1 - \theta)x_2 \in C$$

examples (one convex, two nonconvex sets)

Convex combination and convex hull

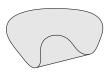

convex combination of x_1, \ldots, x_k : any point x of the form

$$x = \theta_1 x_1 + \theta_2 x_2 + \dots + \theta_k x_k$$

with
$$\theta_1 + \cdots + \theta_k = 1$$
, $\theta_i \ge 0$

convex hull $\operatorname{\mathbf{conv}} S$: set of all convex combinations of points in S

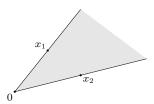

Convex cone

conic (nonnegative) combination of x_1 and x_2 : any point of the form

$$x = \theta_1 x_1 + \theta_2 x_2$$

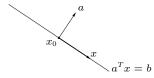

with $\theta_1 \geq 0$, $\theta_2 \geq 0$

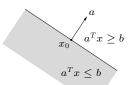

convex cone: set that contains all conic combinations of points in the set

Hyperplanes and halfspaces

hyperplane: set of the form $\{x \mid a^T x = b\}$ $(a \neq 0)$

halfspace: set of the form $\{x \mid a^T x \leq b\}$ $(a \neq 0)$

- ullet a is the normal vector
- hyperplanes are affine and convex; halfspaces are convex

Euclidean balls and ellipsoids

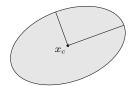

(Euclidean) ball with center x_c and radius r:

$$B(x_c, r) = \{x \mid ||x - x_c||_2 \le r\} = \{x_c + ru \mid ||u||_2 \le 1\}$$

ellipsoid: set of the form

$$\{x \mid (x - x_c)^T P^{-1} (x - x_c) \le 1\}$$

with $P \in \mathbf{S}_{++}^n$ (i.e., P symmetric positive definite)

other representation: $\{x_c + Au \mid ||u||_2 \le 1\}$ with A square and nonsingular

Norm balls and norm cones

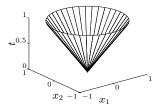

norm: a function $\|\cdot\|$ that satisfies

- $||x|| \ge 0$; ||x|| = 0 if and only if x = 0
- ||tx|| = |t| ||x|| for $t \in \mathbf{R}$
- $||x + y|| \le ||x|| + ||y||$

notation: $\|\cdot\|$ is general (unspecified) norm; $\|\cdot\|_{\text{symb}}$ is particular norm norm ball with center x_c and radius r: $\{x\mid \|x-x_c\|\leq r\}$

norm cone: $\{(x,t) \mid ||x|| \le t\}$

Euclidean norm cone is called secondorder cone

norm balls and cones are convex

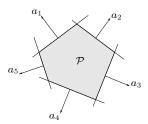

Convex sets 2–8

Polyhedra

solution set of finitely many linear inequalities and equalities

$$Ax \leq b$$
, $Cx = d$

 $(A \in \mathbf{R}^{m \times n}, C \in \mathbf{R}^{p \times n}, \leq \text{is componentwise inequality})$

polyhedron is intersection of finite number of halfspaces and hyperplanes

Convex sets 2–9

Positive semidefinite cone

notation:

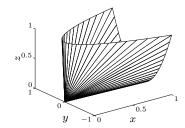

- S^n is set of symmetric $n \times n$ matrices
- $\mathbf{S}^n_+ = \{X \in \mathbf{S}^n \mid X \succeq 0\}$: positive semidefinite $n \times n$ matrices

$$X \in \mathbf{S}^n_+ \iff z^T X z \ge 0 \text{ for all } z$$

 \mathbf{S}^n_+ is a convex cone

• $\mathbf{S}_{++}^n = \{X \in \mathbf{S}^n \mid X \succ 0\}$: positive definite $n \times n$ matrices

example: $\begin{bmatrix} x & y \\ y & z \end{bmatrix} \in \mathbf{S}_{+}^{2}$

Operations that preserve convexity

practical methods for establishing convexity of a set C

1. apply definition

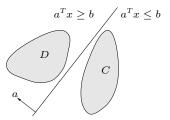

$$x_1, x_2 \in C, \quad 0 \le \theta \le 1 \implies \theta x_1 + (1 - \theta)x_2 \in C$$

- 2. show that C is obtained from simple convex sets (hyperplanes, halfspaces, norm balls, \dots) by operations that preserve convexity
 - intersection
 - affine functions
 - perspective function
 - linear-fractional functions

Separating hyperplane theorem

if C and D are disjoint convex sets, then there exists $a \neq 0$, b such that

$$a^T x \le b \text{ for } x \in C, \qquad a^T x \ge b \text{ for } x \in D$$

the hyperplane $\{x \mid a^T x = b\}$ separates C and D

strict separation requires additional assumptions (e.g., C is closed, D is a singleton)

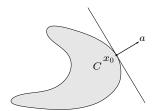

Convex sets 2–19

Supporting hyperplane theorem

supporting hyperplane to set C at boundary point x_0 :

$$\{x \mid a^T x = a^T x_0\}$$

where $a \neq 0$ and $a^T x \leq a^T x_0$ for all $x \in C$

supporting hyperplane theorem: if C is convex, then there exists a supporting hyperplane at every boundary point of C

Convex sets 2–20

Outline

Convex set

Convex functions

Convex problems

Definition

 $f: \mathbf{R}^n \to \mathbf{R}$ is convex if $\operatorname{\mathbf{dom}} f$ is a convex set and

$$f(\theta x + (1 - \theta)y) \le \theta f(x) + (1 - \theta)f(y)$$

for all $x, y \in \operatorname{\mathbf{dom}} f$, $0 \le \theta \le 1$

- f is concave if -f is convex
- f is strictly convex if $\operatorname{dom} f$ is convex and

$$f(\theta x + (1 - \theta)y) < \theta f(x) + (1 - \theta)f(y)$$

for $x, y \in \operatorname{dom} f$, $x \neq y$, $0 < \theta < 1$

Examples on R

convex:

• affine: ax + b on **R**, for any $a, b \in \mathbf{R}$

• exponential: e^{ax} , for any $a \in \mathbf{R}$

ullet powers: x^{α} on \mathbf{R}_{++} , for $\alpha \geq 1$ or $\alpha \leq 0$

• powers of absolute value: $|x|^p$ on **R**, for $p \ge 1$

• negative entropy: $x \log x$ on \mathbf{R}_{++}

concave:

• affine: ax + b on **R**, for any $a, b \in \mathbf{R}$

 \bullet powers: x^{α} on $\mathbf{R}_{++}\text{, for }0\leq\alpha\leq1$

• logarithm: $\log x$ on \mathbf{R}_{++}

Examples on R^n and $R^{m \times n}$

affine functions are convex and concave; all norms are convex examples on \mathbf{R}^n

- affine function $f(x) = a^T x + b$
- \bullet norms: $\|x\|_p = (\sum_{i=1}^n |x_i|^p)^{1/p}$ for $p \geq 1$; $\|x\|_\infty = \max_k |x_k|$

examples on $\mathbb{R}^{m \times n}$ ($m \times n$ matrices)

affine function

$$f(X) = \mathbf{tr}(A^T X) + b = \sum_{i=1}^{m} \sum_{j=1}^{n} A_{ij} X_{ij} + b$$

• spectral (maximum singular value) norm

$$f(X) = ||X||_2 = \sigma_{\max}(X) = (\lambda_{\max}(X^T X))^{1/2}$$

Restriction of a convex function to a line

 $f: \mathbf{R}^n \to \mathbf{R}$ is convex if and only if the function $g: \mathbf{R} \to \mathbf{R}$,

$$g(t) = f(x+tv),$$
 $\operatorname{dom} g = \{t \mid x+tv \in \operatorname{dom} f\}$

is convex (in t) for any $x \in \operatorname{\mathbf{dom}} f$, $v \in \mathbf{R}^n$

can check convexity of \boldsymbol{f} by checking convexity of functions of one variable

example.
$$f: \mathbf{S}^n \to \mathbf{R}$$
 with $f(X) = \log \det X$, $\operatorname{dom} f = \mathbf{S}^n_{++}$

$$g(t) = \log \det(X + tV) = \log \det X + \log \det(I + tX^{-1/2}VX^{-1/2})$$

= $\log \det X + \sum_{i=1}^{n} \log(1 + t\lambda_i)$

where λ_i are the eigenvalues of $X^{-1/2}VX^{-1/2}$

g is concave in t (for any choice of $X \succ 0$, V); hence f is concave

Extended-value extension

extended-value extension \tilde{f} of f is

$$\tilde{f}(x) = f(x), \quad x \in \operatorname{dom} f, \qquad \tilde{f}(x) = \infty, \quad x \notin \operatorname{dom} f$$

often simplifies notation; for example, the condition

$$0 \le \theta \le 1 \implies \tilde{f}(\theta x + (1 - \theta)y) \le \theta \tilde{f}(x) + (1 - \theta)\tilde{f}(y)$$

(as an inequality in $\mathbf{R} \cup \{\infty\}$), means the same as the two conditions

- $\operatorname{dom} f$ is convex
- for $x, y \in \operatorname{dom} f$,

$$0 \le \theta \le 1 \implies f(\theta x + (1 - \theta)y) \le \theta f(x) + (1 - \theta)f(y)$$

First-order condition

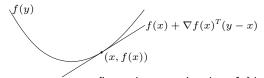

f is **differentiable** if $\operatorname{dom} f$ is open and the gradient

$$\nabla f(x) = \left(\frac{\partial f(x)}{\partial x_1}, \frac{\partial f(x)}{\partial x_2}, \dots, \frac{\partial f(x)}{\partial x_n}\right)$$

exists at each $x \in \operatorname{\mathbf{dom}} f$

1st-order condition: differentiable f with convex domain is convex iff

$$f(y) \ge f(x) + \nabla f(x)^T (y - x)$$
 for all $x, y \in \operatorname{dom} f$

first-order approximation of \boldsymbol{f} is global underestimator

Second-order conditions

f is **twice differentiable** if $\operatorname{\mathbf{dom}} f$ is open and the Hessian $\nabla^2 f(x) \in \mathbf{S}^n$,

$$\nabla^2 f(x)_{ij} = \frac{\partial^2 f(x)}{\partial x_i \partial x_j}, \quad i, j = 1, \dots, n,$$

exists at each $x \in \operatorname{\mathbf{dom}} f$

2nd-order conditions: for twice differentiable f with convex domain

• f is convex if and only if

$$\nabla^2 f(x) \succeq 0$$
 for all $x \in \operatorname{dom} f$

• if $\nabla^2 f(x) \succ 0$ for all $x \in \operatorname{\mathbf{dom}} f$, then f is strictly convex

Examples

quadratic function:
$$f(x) = (1/2)x^T P x + q^T x + r$$
 (with $P \in \mathbf{S}^n$)

$$\nabla f(x) = Px + q, \qquad \nabla^2 f(x) = P$$

convex if $P \succeq 0$

least-squares objective: $f(x) = ||Ax - b||_2^2$

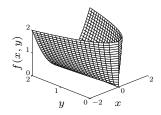

$$\nabla f(x) = 2A^T(Ax - b), \qquad \nabla^2 f(x) = 2A^T A$$

convex (for any A)

quadratic-over-linear: $f(x,y) = x^2/y$

$$\nabla^2 f(x,y) = \frac{2}{y^3} \left[\begin{array}{c} y \\ -x \end{array} \right] \left[\begin{array}{c} y \\ -x \end{array} \right]^T \succeq 0$$

convex for y > 0

log-sum-exp: $f(x) = \log \sum_{k=1}^{n} \exp x_k$ is convex

$$\nabla^2 f(x) = \frac{1}{\mathbf{1}^T z} \operatorname{\mathbf{diag}}(z) - \frac{1}{(\mathbf{1}^T z)^2} z z^T \qquad (z_k = \exp x_k)$$

to show $\nabla^2 f(x) \succeq 0$, we must verify that $v^T \nabla^2 f(x) v \geq 0$ for all v:

$$v^{T} \nabla^{2} f(x) v = \frac{(\sum_{k} z_{k} v_{k}^{2})(\sum_{k} z_{k}) - (\sum_{k} v_{k} z_{k})^{2}}{(\sum_{k} z_{k})^{2}} \ge 0$$

since $(\sum_k v_k z_k)^2 \leq (\sum_k z_k v_k^2)(\sum_k z_k)$ (from Cauchy-Schwarz inequality)

geometric mean: $f(x)=(\prod_{k=1}^n x_k)^{1/n}$ on \mathbf{R}_{++}^n is concave (similar proof as for log-sum-exp)

Epigraph and sublevel set

 α -sublevel set of $f: \mathbb{R}^n \to \mathbb{R}$:

$$C_{\alpha} = \{ x \in \operatorname{dom} f \mid f(x) \le \alpha \}$$

sublevel sets of convex functions are convex (converse is false)

epigraph of
$$f: \mathbb{R}^n \to \mathbb{R}$$
:

$$\operatorname{\mathbf{epi}} f = \{(x,t) \in \mathbf{R}^{n+1} \mid x \in \operatorname{\mathbf{dom}} f, \ f(x) \leq t\}$$

f is convex if and only if $\operatorname{\mathbf{epi}} f$ is a convex set

Jensen's inequality

basic inequality: if f is convex, then for $0 \le \theta \le 1$,

$$f(\theta x + (1 - \theta)y) \le \theta f(x) + (1 - \theta)f(y)$$

extension: if f is convex, then

$$f(\mathbf{E}\,z) \le \mathbf{E}\,f(z)$$

for any random variable z

basic inequality is special case with discrete distribution

$$\operatorname{prob}(z=x) = \theta, \quad \operatorname{prob}(z=y) = 1 - \theta$$

Operations that preserve convexity

practical methods for establishing convexity of a function

- 1. verify definition (often simplified by restricting to a line)
- 2. for twice differentiable functions, show $\nabla^2 f(x) \succeq 0$
- 3. show that f is obtained from simple convex functions by operations that preserve convexity
 - nonnegative weighted sum
 - composition with affine function
 - pointwise maximum and supremum
 - composition
 - minimization
 - perspective

Positive weighted sum & composition with affine function

nonnegative multiple: αf is convex if f is convex, $\alpha \geq 0$ sum: f_1+f_2 convex if f_1,f_2 convex (extends to infinite sums, integrals) composition with affine function: f(Ax+b) is convex if f is convex

examples

• log barrier for linear inequalities

$$f(x) = -\sum_{i=1}^{m} \log(b_i - a_i^T x),$$
 $\mathbf{dom} f = \{x \mid a_i^T x < b_i, i = 1, \dots, m\}$

• (any) norm of affine function: f(x) = ||Ax + b||

Pointwise maximum

if f_1, \ldots, f_m are convex, then $f(x) = \max\{f_1(x), \ldots, f_m(x)\}$ is convex

examples

- piecewise-linear function: $f(x) = \max_{i=1,...,m} (a_i^T x + b_i)$ is convex
- sum of r largest components of $x \in \mathbf{R}^n$:

$$f(x) = x_{[1]} + x_{[2]} + \dots + x_{[r]}$$

is convex $(x_{[i]}$ is ith largest component of x) proof:

$$f(x) = \max\{x_{i_1} + x_{i_2} + \dots + x_{i_r} \mid 1 \le i_1 < i_2 < \dots < i_r \le n\}$$

Pointwise supremum

if f(x,y) is convex in x for each $y \in \mathcal{A}$, then

$$g(x) = \sup_{y \in \mathcal{A}} f(x, y)$$

is convex

examples

- support function of a set C: $S_C(x) = \sup_{y \in C} y^T x$ is convex
- distance to farthest point in a set C:

$$f(x) = \sup_{y \in C} ||x - y||$$

ullet maximum eigenvalue of symmetric matrix: for $X \in \mathbf{S}^n$,

$$\lambda_{\max}(X) = \sup_{\|y\|_2 = 1} y^T X y$$

Composition with scalar functions

composition of $g: \mathbf{R}^n \to \mathbf{R}$ and $h: \mathbf{R} \to \mathbf{R}$:

$$f(x) = h(g(x))$$

 $\begin{array}{ll} f \text{ is convex if} & g \text{ convex, } h \text{ convex, } \tilde{h} \text{ nondecreasing} \\ & g \text{ concave, } h \text{ convex, } \tilde{h} \text{ nonincreasing} \end{array}$

• proof (for n = 1, differentiable g, h)

$$f''(x) = h''(g(x))g'(x)^{2} + h'(g(x))g''(x)$$

ullet note: monotonicity must hold for extended-value extension \tilde{h}

examples

- $\exp g(x)$ is convex if g is convex
- 1/g(x) is convex if g is concave and positive

Outline

Convex set

Convex functions

Convex problems

Optimization problem in standard form

minimize
$$f_0(x)$$
 subject to $f_i(x) \leq 0, \quad i=1,\ldots,m$ $h_i(x)=0, \quad i=1,\ldots,p$

- $x \in \mathbf{R}^n$ is the optimization variable
- $f_0: \mathbf{R}^n \to \mathbf{R}$ is the objective or cost function
- $f_i: \mathbf{R}^n \to \mathbf{R}, i=1,\ldots,m$, are the inequality constraint functions
- $h_i: \mathbf{R}^n \to \mathbf{R}$ are the equality constraint functions

optimal value:

$$p^* = \inf\{f_0(x) \mid f_i(x) \le 0, \ i = 1, \dots, m, \ h_i(x) = 0, \ i = 1, \dots, p\}$$

- $p^* = \infty$ if problem is infeasible (no x satisfies the constraints)
- $p^{\star} = -\infty$ if problem is unbounded below

Implicit constraints

the standard form optimization problem has an implicit constraint

$$x \in \mathcal{D} = \bigcap_{i=0}^{m} \operatorname{dom} f_i \cap \bigcap_{i=1}^{p} \operatorname{dom} h_i,$$

- ullet we call ${\mathcal D}$ the **domain** of the problem
- the constraints $f_i(x) \leq 0$, $h_i(x) = 0$ are the explicit constraints
- ullet a problem is **unconstrained** if it has no explicit constraints (m=p=0)

example:

minimize
$$f_0(x) = -\sum_{i=1}^k \log(b_i - a_i^T x)$$

is an unconstrained problem with implicit constraints $a_i^T x < b_i$

Feasibility problem

$$\begin{array}{ll} \text{find} & x \\ \text{subject to} & f_i(x) \leq 0, \quad i=1,\ldots,m \\ & h_i(x)=0, \quad i=1,\ldots,p \end{array}$$

can be considered a special case of the general problem with $f_0(x) = 0$:

$$\begin{array}{ll} \text{minimize} & 0 \\ \text{subject to} & f_i(x) \leq 0, \quad i=1,\ldots,m \\ & h_i(x)=0, \quad i=1,\ldots,p \end{array}$$

- $p^{\star} = 0$ if constraints are feasible; any feasible x is optimal
- ullet $p^\star = \infty$ if constraints are infeasible

Convex optimization problem

standard form convex optimization problem

minimize
$$f_0(x)$$

subject to $f_i(x) \leq 0, \quad i = 1, \dots, m$
 $a_i^T x = b_i, \quad i = 1, \dots, p$

- ullet $f_0,\,f_1,\,\ldots$, f_m are convex; equality constraints are affine
- ullet problem is *quasiconvex* if f_0 is quasiconvex (and f_1, \ldots, f_m convex)

often written as

minimize
$$f_0(x)$$

subject to $f_i(x) \leq 0, \quad i = 1, \dots, m$
 $Ax = b$

important property: feasible set of a convex optimization problem is convex

example

$$\begin{array}{ll} \text{minimize} & f_0(x) = x_1^2 + x_2^2 \\ \text{subject to} & f_1(x) = x_1/(1+x_2^2) \leq 0 \\ & h_1(x) = (x_1+x_2)^2 = 0 \end{array}$$

- f_0 is convex; feasible set $\{(x_1, x_2) \mid x_1 = -x_2 \leq 0\}$ is convex
- ullet not a convex problem (according to our definition): f_1 is not convex, h_1 is not affine
- equivalent (but not identical) to the convex problem

minimize
$$x_1^2 + x_2^2$$

subject to $x_1 \le 0$
 $x_1 + x_2 = 0$

Local and global optima

$$z$$
 feasible, $||z-x||_2 \le R \implies f_0(z) \ge f_0(x)$

consider
$$z = \theta y + (1 - \theta)x$$
 with $\theta = R/(2\|y - x\|_2)$

- $||y x||_2 > R$, so $0 < \theta < 1/2$
- z is a convex combination of two feasible points, hence also feasible
- $||z x||_2 = R/2$ and

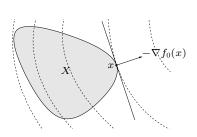

$$f_0(z) \le \theta f_0(x) + (1 - \theta) f_0(y) < f_0(x)$$

which contradicts our assumption that x is locally optimal

Optimality criterion for differentiable f_0

 \boldsymbol{x} is optimal if and only if it is feasible and

$$\nabla f_0(x)^T (y-x) \ge 0$$
 for all feasible y

if nonzero, $\nabla f_0(x)$ defines a supporting hyperplane to feasible set X at x

• unconstrained problem: x is optimal if and only if

$$x \in \operatorname{\mathbf{dom}} f_0, \qquad \nabla f_0(x) = 0$$

equality constrained problem

minimize
$$f_0(x)$$
 subject to $Ax = b$

x is optimal if and only if there exists a ν such that

$$x \in \operatorname{dom} f_0$$
, $Ax = b$, $\nabla f_0(x) + A^T \nu = 0$

• minimization over nonnegative orthant

minimize
$$f_0(x)$$
 subject to $x \succeq 0$

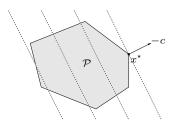

x is optimal if and only if

$$x \in \operatorname{dom} f_0, \qquad x \succeq 0, \qquad \left\{ \begin{array}{ll} \nabla f_0(x)_i \geq 0 & x_i = 0 \\ \nabla f_0(x)_i = 0 & x_i > 0 \end{array} \right.$$

Linear program (LP)

$$\begin{array}{ll} \text{minimize} & c^Tx+d\\ \text{subject to} & Gx \preceq h\\ & Ax=b \end{array}$$

- convex problem with affine objective and constraint functions
- feasible set is a polyhedron

Examples

diet problem: choose quantities x_1, \ldots, x_n of n foods

- ullet one unit of food j costs c_j , contains amount a_{ij} of nutrient i
- healthy diet requires nutrient i in quantity at least b_i

to find cheapest healthy diet,

$$\begin{array}{ll} \text{minimize} & c^T x \\ \text{subject to} & Ax \succeq b, \quad x \succeq 0 \end{array}$$

piecewise-linear minimization

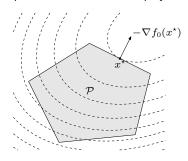

minimize
$$\max_{i=1,...,m} (a_i^T x + b_i)$$

equivalent to an LP

minimize
$$t$$
 subject to $a_i^T x + b_i \leq t, \quad i = 1, \dots, m$

Quadratic program (QP)

- $P \in \mathbf{S}_{+}^{n}$, so objective is convex quadratic
- minimize a convex quadratic function over a polyhedron

Examples

least-squares

minimize
$$||Ax - b||_2^2$$

- analytical solution $x^* = A^{\dagger}b$ (A^{\dagger} is pseudo-inverse)
- can add linear constraints, e.g., $l \leq x \leq u$

linear program with random cost

minimize
$$\bar{c}^T x + \gamma x^T \Sigma x = \mathbf{E} \, c^T x + \gamma \, \mathbf{var}(c^T x)$$
 subject to $Gx \leq h$, $Ax = b$

- ullet c is random vector with mean \bar{c} and covariance Σ
- ullet hence, c^Tx is random variable with mean \bar{c}^Tx and variance $x^T\Sigma x$
- $\gamma>0$ is risk aversion parameter; controls the trade-off between expected cost and variance (risk)
